1 What is in this catalogue **1**

2 How to read the pictures **3**

3 Unphysical configurations: examples **4**

4 Energy levels of every sector **5**

5 Eigenstates of the 2×2 ladder **6**
5.1 2×2, sector $B = -2$ (2 physical states) . . . 6
5.2 2×2, sector $B = -1$ (20 physical states) . . . 7
5.3 2×2, sector $B = +0$ (38 physical states) . . . 9
5.4 2×2, sector $B = +1$ (20 physical states) . . . 10
5.5 2×2, sector $B = +2$ (2 physical states) . . . 12

6 Eigenstates of the 2×3 ladder **13**
6.1 2×3, sector $B = -3$ (4 physical states) . . . 13
6.2 2×3, sector $B = -2$ (95 physical states) . . . 14
6.3 2×3, sector $B = -1$ (426 physical states) . . . 16
6.4 2×3, sector $B = +0$ (677 physical states) . . . 18
6.5 2×3, sector $B = +1$ (426 physical states) . . . 20
6.6 2×3, sector $B = +2$ (95 physical states) . . . 22
6.7 2×3, sector $B = +3$ (4 physical states) . . . 24

7 Eigenstates of the 2×4 ladder **25**
7.1 2×4, sector $B = -4$ (8 physical states) . . . 25
7.2 2×4, sector $B = -3$ (350 physical states) . . . 27
7.3 2×4, sector $B = -2$ (2,869 physical states) . . . 30
7.4 2×4, sector $B = -1$ (8,934 physical states) . . . 33
7.5 2×4, sector $B = +0$ (12,843 physical states) . . . 36
7.6 2×4, sector $B = +1$ (8,934 physical states) . . . 39
7.7 2×4, sector $B = +2$ (2,869 physical states) . . . 42
7.8 2×4, sector $B = +3$ (350 physical states) . . . 45
7.9 2×4, sector $B = +4$ (8 physical states) . . . 48

8 All physical states of the 2×2 ladder **50**
8.1 2×2, sector $B = -2$: all 2 states . . . 50
8.2 2×2, sector $B = -1$: all 20 states . . . 51
8.3 2×2, sector $B = +0$: all 38 states . . . 52
8.4 2×2, sector $B = +1$: all 20 states . . . 54
8.5 2×2, sector $B = +2$: all 2 states . . . 55

9 All physical states of the 2×3 ladder **56**
9.1 2×3, sector $B = -3$: all 4 states . . . 56
9.2 2×3, sector $B = -2$: all 95 states . . . 57
9.3 2×3, sector $B = -1$: all 426 states . . . 64
9.4 2×3, sector $B = +0$: all 677 states . . . 93
9.5 2×3, sector $B = +1$: all 426 states . . . 139
9.6 2×3, sector $B = +2$: all 95 states . . . 168
9.7 2×3, sector $B = +3$: all 4 states . . . 175

1 What is in this catalogue

- How to read the pictures and labels (section 2).
- Why a configuration can be unphysical, with checked examples (section 3).
- The lowest energy levels of every baryon sector of every lattice (section 4).

- For each lattice and sector B: the ground state and excited states 1–3, each drawn as its dominant configurations with amplitude and weight (sections 5–7).
- Every physical state of 2×2 (82) and 2×3 (1 727), one picture each, sector by sector (sections 8–9). The 2×4 ladder has 37 165 physical states (about 2 000 pages if drawn); all of them are listed in the companion file `reports/physical_states_catalogue_all_states.csv`.

Number of physical (gauge-invariant) states per baryon sector

lattice	total	per sector B
2×2	82	-2: 2, -1: 20, $+0$: 38, $+1$: 20, $+2$: 2
2×3	1,727	-3: 4, -2: 95, -1: 426, $+0$: 677, $+1$: 426, $+2$: 95, $+3$: 4
2×4	37,165	-4: 8, -3: 350, -2: 2869, -1: 8934, $+0$: 12843, $+1$: 8934, $+2$: 2869, $+3$: 350, $+4$: 8

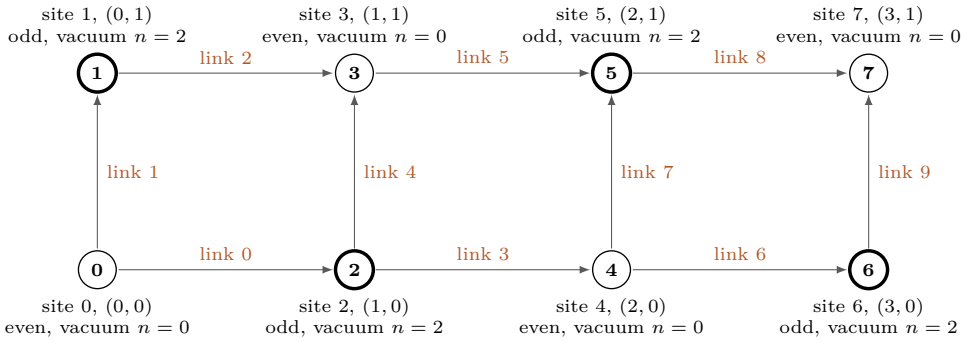

Model and parameters

Hamiltonian (`src/skqd/hamiltonian.py`), links truncated at $j_{\max} = \frac{1}{2}$:

$$H = \sum_l H_l^{\text{hop}} + m \sum_x (-1)^{x_1+x_2} n_x + \frac{g^2}{2} \sum_l j_l(j_l+1) - \frac{1}{2g^2} \sum_P \left(W_P + W_P^\dagger\right), \qquad g^2 = 4, \quad m = \tfrac{3}{16} g^2 = 0.75.$$

Energies and eigenvectors are exact diagonalisations of each sector (`numpy eigh`, or `scipy eigsh` for the two largest 2×4 sectors) of the package's own Hamiltonian (`skqd.exact.Model`); the ground-state energies equal the stored references `validation/E3.json` (section 4). Bit strings come from `skqd.codec.Codec`.

2 How to read the pictures

The 2×4 ladder; 2×2 and 2×3 are its first two or three columns.

Sites and quarks (staggered fermions). Each site holds a quark field with two colours, so its occupation is $n = 0, 1, 2$: the number in the circle (white = 0, half-filled = 1, dark = 2). In the staggered (Dirac-sea) vacuum $n = 0$ on *even* sites ($x_1 + x_2$ even, thin circle) and $n = 2$ on *odd* sites (thick circle). Particles are deviations from that vacuum, written next to the site in brown:

	$n = 0$	$n = 1$	$n = 2$
even site	vacuum	q (one quark)	$2q$ (two quarks)
odd site	$2\bar{q}$ (two holes)	$\bar{q}$ (one hole = antiquark)	vacuum

The mass term $m \sum_x (-1)^{x_1+x_2} n_x$ makes every quark or antiquark cost energy m relative to the vacuum.

Links (colour-electric flux). Each link carries $j = 0$ (grey dashed, "0": no flux) or $j = \frac{1}{2}$ (red, "$\frac{1}{2}$": one unit of flux), with electric energy $\frac{g^2}{2} j(j+1) = \frac{3}{8} g^2$ per flux link.

Gauss's law and the intertwiner ι. At every site the colour spins arriving there (each flux link brings $\frac{1}{2}$; $n = 1$ brings $\frac{1}{2}$; $n = 0, 2$ bring 0) must add up to total spin 0, so their number must be even. At an interior site with flux on all three links and $n = 1$ there are two ways to do this, labelled $\iota = 0, 1$ (purple, shown only there).

Baryon number B. $B = \frac{1}{2} \sum_x \left(n_x - n_x^{\text{vac}} \right)$. In SU(2) a baryon is two quarks, so $B = 1$ means two extra quarks, while quark–antiquark pairs (mesons) have $B = 0$. The Hamiltonian conserves B, so each B is a separate sector; the SKQD work of this project uses $B = 0$ ($2B = 0$) and $B = 1$ ($2B = 2$).

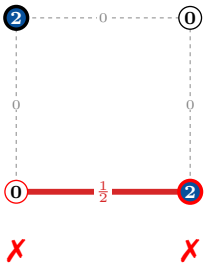

The text under each picture.

- $\#k$: position in the package's basis list (`skqd.basis`); "$\#i$ in sector": position inside its sector.
- E_{diag}: diagonal energy of that configuration alone (mass + electric terms) – not an eigenvalue.
- bits: the qubit encoding (`skqd.codec`), one group per site $0, 1, 2, \ldots$; in each group the flux bits of the site's links in link-number order, then the matter bit ($n/2$, or ι at a three-flux $n = 1$ site).
- $n = (\ldots)$ per site, $j = (\ldots)$ per link in link-number order.
- In the eigenstate sections: c = amplitude of the configuration in the eigenstate (global phase fixed so the largest amplitude is real and positive) and $|c|^2$ its weight.

3 Unphysical configurations: examples

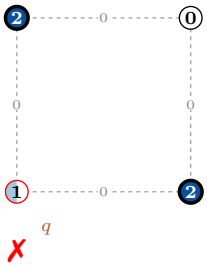

A configuration is physical only if Gauss's law holds at *every* site. Each example below was checked against the package: it is not in the basis, and `skqd.vertex.kernel_dim` $= 0$ (no singlet) at the sites marked ✗.

(a) Open flux string

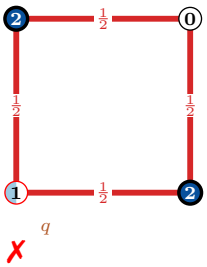

One flux link with nothing at its ends: each end site has a single spin-$\frac{1}{2}$ and no partner. Flux must close into a loop or end on charges.

(b) Lone quark

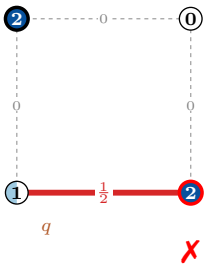

One quark ($n = 1$) on site 0 with no flux: an isolated colour charge whose spin-$\frac{1}{2}$ has nothing to pair with.

(c) Flux loop with a stray quark

The closed loop alone is fine, but site 0 also has a quark: two flux links + one quark = three spin-$\frac{1}{2}$ objects, so no spin 0.

(d) String with only one end on a quark

Site 0 is fine (flux + quark pair up), but site 2 at the other end has nothing to pair with. A valid meson would also have $n = 1$ at site 2.

Bit strings that are not states

The qubit encoding can also produce strings that describe no state; the decoder (`skqd.codec.Codec.decode`) rejects them:

	bits (sites 0,1,2,3)	decoder
physical state #3	`000 000 001 001`	`accepted`
one copy of link 0 changed	`100 000 001 001`	`link`
corner with one flux, matter bit 1	`011 100 000 000`	`flag`

- `link`: every link is stored at both of its end sites; a physical state has equal copies.
- `flag`: a matter-bit value the site's flux pattern does not allow (n is already forced).
- `sector`: a perfectly physical state, rejected only because its B is not the one being studied – it belongs to another sector of this catalogue.

Configurations like (a)–(d) cannot even be written in this encoding: it stores only Gauss-law-respecting site states (6 per corner site, 13 per interior site), which is why bit-level errors appear as `link` or `flag` rejections instead.

4 Energy levels of every sector

E_0 is the ground state, E_1, E_2, E_3 the first three excited states ($g^2 = 4$, $m = 0.75$). An asterisk marks a degenerate level; inside a degenerate level the individual eigenvectors are not unique. Last column: largest difference from the stored references `validation/E3.json`.

2×2

B	dim	E_0	E_1	E_2	E_3	check vs E3.json

5 Eigenstates of the 2×2 ladder

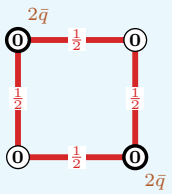

5.1 2×2, sector $B = -2$ (2 physical states)

level		configs drawn	weight covered	participation ratio
$E_0 = -0.010399$	ground state	1	99.8%	1.0
$E_1 = +6.010399$	excited state 1	1	99.8%	1.0

Most important configurations of each level (largest weight first, up to 6 or until 95% of the weight is covered); cards of one level share a colour. Participation ratio $= 1/\sum |c|^4 \approx$ number of configurations the state is spread over.

#0 ($B=-2$, #0 in sector)
$E_{\text{diag}} = +0.000$
E_0 (ground state): $c = +0.9991$,
$|c|^2 = 0.9983$
000 000 000 000
$n = (0\,0\,0\,0)$ $j = (0\,0\,0\,0)$

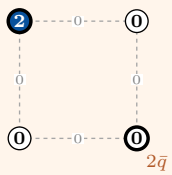

#66 ($B=-2$, #1 in sector)
$E_{\text{diag}} = +6.000$
E_1 (excited state 1): $c = +0.9991$,
$|c|^2 = 0.9983$
110 110 110 110
$n = (0\,0\,0\,0)$ $j = (\frac{1}{2}\,\frac{1}{2}\,\frac{1}{2}\,\frac{1}{2})$

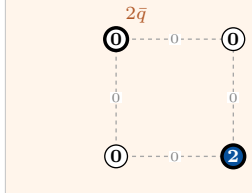

5.2 2×2, sector $B = -1$ (20 physical states)

level		configs drawn	weight covered	participation ratio
$E_0 = -1.861588$	ground state	5	95.6%	2.6
$E_1 = -1.819745$	excited state 1	4	95.3%	2.4
$E_2 = +0.208229$	excited state 2	6	76.0%	8.1
$E_3 = +0.450558$	excited state 3	6	71.4%	8.9

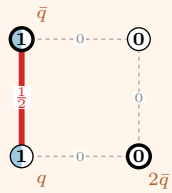

Most important configurations of each level (largest weight first, up to 6 or until 95% of the weight is covered); cards of one level share a colour. Participation ratio $= 1/\sum |c|^4 \approx$ number of configurations the state is spread over.

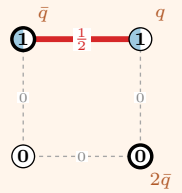

#4 ($B=-1$, #2 in sector)
$E_{\text{diag}} = -1.500$
E_0 (ground state): $c = +0.6614$,
$|c|^2 = 0.4375$
000 001 000 000
$n = (0\,2\,0\,0)$ $j = (0\,0\,0\,0)$

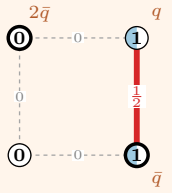

#2 ($B=-1$, #1 in sector)
$E_{\text{diag}} = -1.500$
E_0 (ground state): $c = -0.6614$,
$|c|^2 = 0.4375$
000 000 001 000
$n = (0\,0\,2\,0)$ $j = (0\,0\,0\,0)$

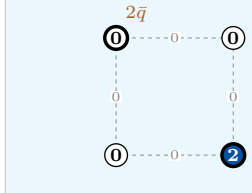

#28 ($B=-1$, #7 in sector)
$E_{\text{diag}} = +1.500$
E_0 (ground state): $c = +0.1645$,
$|c|^2 = 0.0271$
010 100 000 000
$n = (1\,1\,0\,0)$ $j = (0\,\frac{1}{2}\,0\,0)$

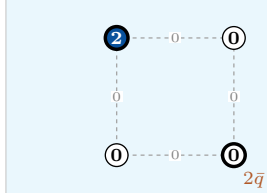

#20 ($B=-1$, #5 in sector)
$E_{\text{diag}} = +1.500$
E_0 (ground state): $c = -0.1645i$,
$|c|^2 = 0.0271$
000 010 000 100
$n = (0\,1\,0\,1)$ $j = (0\,0\,\frac{1}{2}\,0)$

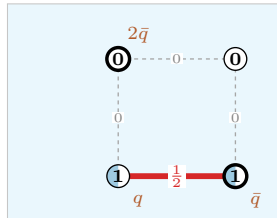

#16 ($B=-1$, #4 in sector)
$E_{\text{diag}} = +1.500$
E_0 (ground state): $c = +0.1645$,
$|c|^2 = 0.0271$
000 000 010 010
$n = (0\,0\,1\,1)$ $j = (0\,0\,0\,\frac{1}{2})$

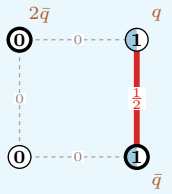

#2 ($B=-1$, #1 in sector)
$E_{\text{diag}} = -1.500$
E_1 (excited state 1): $c = +0.6745$,
$|c|^2 = 0.4549$
000 000 001 000
$n = (0\,0\,2\,0)$ $j = (0\,0\,0\,0)$

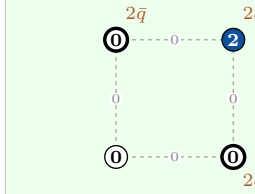

#4 ($B=-1$, #2 in sector)
$E_{\text{diag}} = -1.500$
E_1 (excited state 1): $c = +0.6745$,
$|c|^2 = 0.4549$
000 001 000 000
$n = (0\,2\,0\,0)$ $j = (0\,0\,0\,0)$

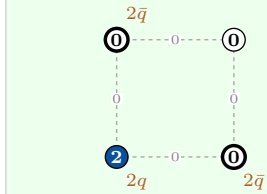

#41 ($B=-1$, #10 in sector)
$E_{\text{diag}} = +1.500$
E_1 (excited state 1): $c = +0.1477i$,
$|c|^2 = 0.0218$
100 000 100 000
$n = (1\,0\,1\,0)$ $j = (\frac{1}{2}\,0\,0\,0)$

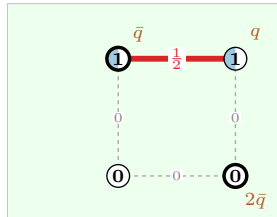

#16 ($B=-1$, #4 in sector)
$E_{\text{diag}} = +1.500$
E_1 (excited state 1): $c = -0.1477$,
$|c|^2 = 0.0218$
000 000 010 010
$n = (0\,0\,1\,1)$ $j = (0\,0\,0\,\frac{1}{2})$

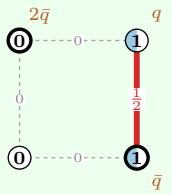

#1 ($B=-1$, #0 in sector)
$E_{\text{diag}} = +1.500$
E_2 (excited state 2): $c = +0.3796$,
$|c|^2 = 0.1441$
000 000 000 001
$n = (0\,0\,0\,2)$ $j = (0\,0\,0\,0)$

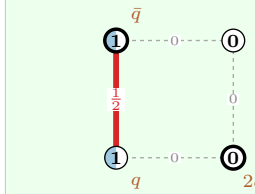

#8 ($B=-1$, #3 in sector)
$E_{\text{diag}} = +1.500$
E_2 (excited state 2): $c = +0.3796$,
$|c|^2 = 0.1441$
001 000 000 000
$n = (2\,0\,0\,0)$ $j = (0\,0\,0\,0)$

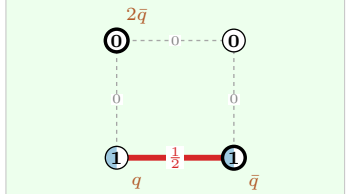

#20 ($B=-1$, #5 in sector)
$E_{\text{diag}} = +1.500$
E_2 (excited state 2): $c = +0.3436i$,
$|c|^2 = 0.1180$
000 010 000 100
$n = (0\,1\,0\,1)$ $j = (0\,0\,\frac{1}{2}\,0)$

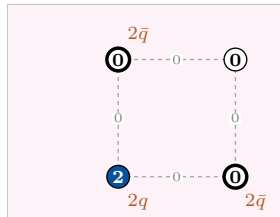

#16 ($B=-1$, #4 in sector)
$E_{\text{diag}} = +1.500$
E_2 (excited state 2): $c = -0.3436$,
$|c|^2 = 0.1180$
000 000 010 010
$n = (0\,0\,1\,1)$ $j = (0\,0\,0\,\frac{1}{2})$

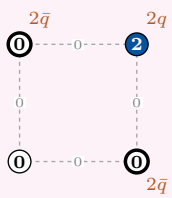

#28 ($B=-1$, #7 in sector)
$E_{\text{diag}} = +1.500$
E_2 (excited state 2): $c = +0.3436$,
$|c|^2 = 0.1180$
010 100 000 000
$n = (1\,1\,0\,0)$ $j = (0\,\frac{1}{2}\,0\,0)$

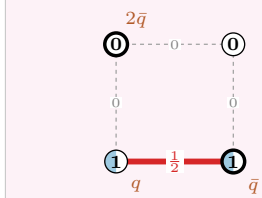

#41 ($B=-1$, #10 in sector)
